Integrative Biology, UCB
I. Does Exercise Prevent Aging?

II. Does Exercise Slow Aging or Compensate for Aging Effects?

III. Why Exercise?

IV. How to Exercise?
Does Exercise Prevent Aging?

- Yes?!
- No?!
- Exercise Slows Aging and Compensates for Aging Effects.
Why Exercise?

- Cardiovascular Fitness & Health
- Metabolic Fitness & Health
- Muscular-Skeletal Strength, Flexibility & Health
- Freedom From Injury
- Antioxidant Defenses
- Sense of Well Being
Maximal Oxygen Consumption ($VO_2\text{max}$) is the standard for cardiovascular fitness.

$VO_2\text{max}$ is increased by regular, prolonged exercise.

$VO_2\text{max}$ declines with aging, but can be maintained at high levels despite advancing years.
Leg Cycler Ergometer Evaluation of Maximal $O_2$ Consumption ($VO_2\text{max}$)

QuickTime™ and a Motion JPEG OpenDML decompressor are needed to see this picture.
Treadmill Evaluation of Maximal O₂ Consumption (VO₂max)
Treadmill Evaluation of a Cardiac Patient-Exercise Stress Test
Figure 1-7  Relationship between oxygen consumption ($\dot{V}_{O_2}$) and external work rate (power output). In response to increments in power output, both trained and untrained individuals respond with an increase in $\dot{V}_{O_2}$. The greater ability of trained individuals to sustain a high power output is largely due to a greater maximal O$_2$ consumption ($\dot{V}_{O_2}^{\text{max}}$).
Figure 32-1 (b) $y = V_{O2\text{max}}$ (ml $\cdot$ kg$^{-1}$ $\cdot$ min$^{-1}$). Although training will improve $V_{O2\text{max}}$ and the quality of life in the elderly, it will not prevent indefinitely the decline in functional capacity. $x = \text{age (hr)}$. Adapted from Suominen et al., 1980.
Cardiovascular Fitness & Health

- Regular prolonged exercise offers protection against having cardiovascular disease (Decreases Morbidity)
- Regular prolonged exercise offers protection against dying from cardiovascular disease (Decreases Mortality)
Figure 24-6  Deaths from CHD in longshoremen according to physical activity of work (range in kcal • min⁻¹) and age at death. Shaded bars = heavy activity (5.2 - 7.5 kcal • min⁻¹); unshaded bars = moderate and light activity (1.5 - 5.0 kcal • min⁻¹). The relative risk of developing CHD for moderate and light exercise groups compared to heavy exercise groups given above bars. Adapted from Paffenbarger and Hale, 1975.
Why Exercise?

- Cardiovascular Fitness & Health
- Metabolic Fitness & Health
- Muscular-Skeletal Strength, Flexibility & Health
- Freedom From Injury
- Antioxidant Defenses
- Sense of Well Being
Metabolic Fitness & Health

- Regular Physical Exercise Helps to Control Age-Related Increases in Body Fatness
- Regular Physical Exercise Reduces the Incidence and Severity of Type II Diabetes (NIDDM).
U.S. Obesity Trends in Adults

Fat is a Wonderful Energy Storage Form,
Butt is a risk factor for chronic diseases.
Figure 25-2  Relationship of body mass index and the risk of death from all causes.  
Actual Causes of Death in the United States, 1990*

*Numbers approximated from various studies that used different approaches to derive estimates.

Contribution of Overweight and Obesity to Mortality from Cancer in the United States.
Data are from the Cancer Prevention Study II, 1982 through 1998.
Figure 1. Summary of Mortality from Cancer According to Body-Mass Index for U.S. Men in the Cancer Prevention Study II, 1982 through 1998.

For each relative risk, the comparison was between men in the highest body-mass-index (BMI) category (indicated in parentheses) and men in the reference category (body-mass index, 18.5 to 24.9). Asterisks indicate relative risks for men who never smoked. Results of the linear test for trend were significant (P≤0.05) for all cancer sites.
Crossover Concept

- Exercise prescriptions to oxidize body fat need consider the Crossover Concept.
- At exercise intensities eliciting greater than 45-50% VO₂max, the body fuel selection switches, crossover from, preponderance of lipid to mainly carbohydrate (glycogen, glucose, lactate).
Crossover Concept

Exercise Easier & Longer

- % Fat
- % CHO

% CHO or Fat vs. % VO₂max
Figure 2. Cumulative Incidence of Diabetes According to Study Group.

The diagnosis of diabetes was based on the criteria of the American Diabetes Association. The incidence of diabetes differed significantly among the three groups (P<0.001 for each comparison).

Figure 18-5 A motor unit, consisting of a cell body, the outgrowing $\alpha$ motoneuron, and all of the muscle fibers it innervates. In this drawing, only two fibers are shown; in reality the number of muscle cells in a single motor unit ranges from several hundred to several thousand.
Figure 17-1 Muscle tissue is composed of muscle bundles (fascicles), muscle fibers (cells), myofibrils, and myofilaments (actin and myosin). From Edington and Edgerton
Figure 19-8  Relationship between number of motor units (MUs) and age in young and older men and women. There was a significant reduction in numbers of MUs with age ($P < 0.001$). Adapted from Doherty et al., 1993.
Figure 19-11 Weekly measurements of dynamic muscle strength (1-repetition maximum) of left knee extensors and flexors. Results are means ± SE. From Frontera et al., 1988. Used with permission.
Figure 19-2 Serial sections of quadriceps muscle from two different athletes, stained with two different stains: (a) and (b) from an outstanding sprinter, (c) and (d) from an outstanding distance runner. Sections (a) and (c) are stained for succinic dehydrogenase (SDHase); (b) and (d) stained for alkaline myofibrillar-ATPase stain (M-ATPase). Note that fast fibers, which stain dark with M-ATPase, often are pale and stain weakly with SDHase. FT = fast-twitch fibers; ST = slow-twitch fibers. Note the two dark FT fibers in (d), which also stain dark for SDHase in (c). These are FOG fibers (see Figure 18-15). SOURCE: Gollnick, et al., 1972. Used with permission.
Figure 19-13  Effects of strength training on the area of type I and type II fibers of vastus lateralis muscle of the left leg. Results are means ± SE. * Different from pretraining measurements (P < 0.05). SOURCE: Frontera et al., 1988. Used with permission.

Antioxidant Defenses

- Regular Physical Exercise Helps to Increase or Maintain Control Age-Related Decreases in Muscle Mitochondrial Mass and Antioxidant Defenses
- Training can result in **100% Increments** in Mitochondrial Mass, Oxidative (Respiratory Enzymes) and Related Enzymes for Defense Against Oxygen-Free Radicals
Figure 17-1  Muscle tissue is composed of muscle bundles (fascicles), muscle fibers (cells), myofibrils, and myofilaments (actin and myosin). From Edington and Edgerton
Figure 6-3  Cross sections of human skeletal muscle tissue illustrating the sampling design used for analyzing muscle respiratory structures. The low-level magnification is used for assessing capillarity and fiber size. The intermediate magnification allows for estimating the volume density of mitochondria and other sarcoplasmic components. The highest magnification allows measurement of mitochondria compartmental spaces and membrane surface areas (arrows = capillaries; c= capillary; e = erythrocyte; mc = central mitochondria; mf = myofibrils; cr = cristae; g = glycogen; gm = mitochondrial granule; ma = matrix; im = intermembrane space; om = outer mitochondrial membrane.
Figure 6-4  Cross section of a portion of a human muscle fiber exposing the A-and I-band and the Z-line regions. Lipid droplets (li) are seen in contact with mitochondria (m). It is evident that the mitochondria in this muscle fiber form an extensively branched tubular network, or reticulum. SOURCE: Hoppeler, 1986. Used with permission.

Though I look old, yet I am strong and lusty;  
For in my youth I never did apply Hot and rebellious liquors in my blood  
Nor did not with unbashful forehead woo  
The means of weakness and debility;  
Therefore my age is as a lusty winter,  
Frosty, but kindly.  Let me go with you;  
I’ll do the service of a younger man  
In all your business and necessities.
