

Office hours
3-4pm Wednesday, Dec. 10
304A Stanley Hall

Review session
5pm Thursday, Dec. 11
GPB100

Final exam
12:30pm Saturday, Dec. 13
277 Cory Hall (NE campus)

Marker is linked to polymorphism in expression regulation cascade

Locally acting regulatory variant

Locally acting polymorphisms

Polymorphism responsible for mRNA difference is at the locus of the gene itself

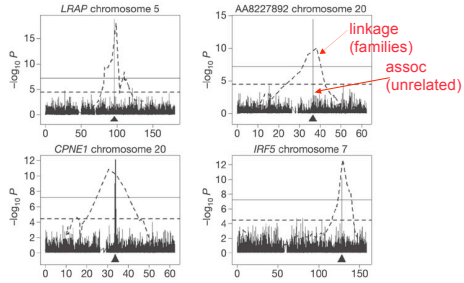

Nonlocal polymorphisms

Association in multiple populations

Association of human transcripts

Mapping determinants of human gene expression by regional and genome-wide association

Wenqiang G. Cheng^{1,2}, Richard S. Spelman¹, Kathryn G. Eaves¹, Teresa M. Weber^{1,3}, Michael Morley¹, & Joshua T. Burchard¹

A new brand of genetic variation

Weird genetics of read-through

Weird genetics of read-through

Cytoplasmic aggregates of Sup35

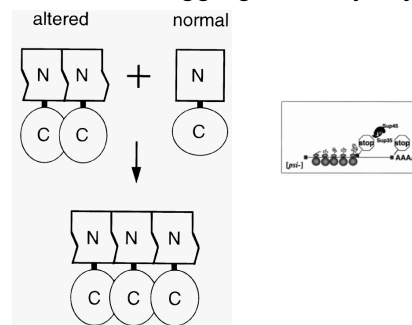

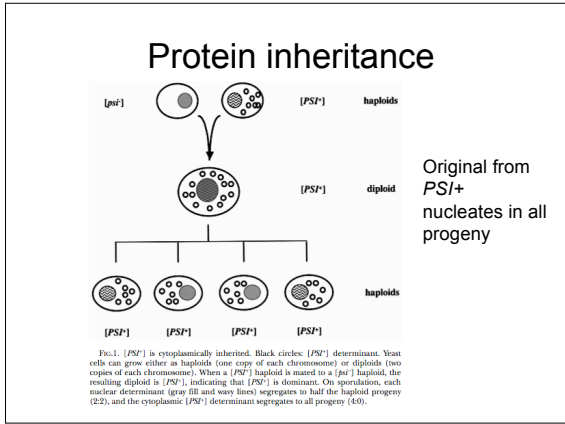

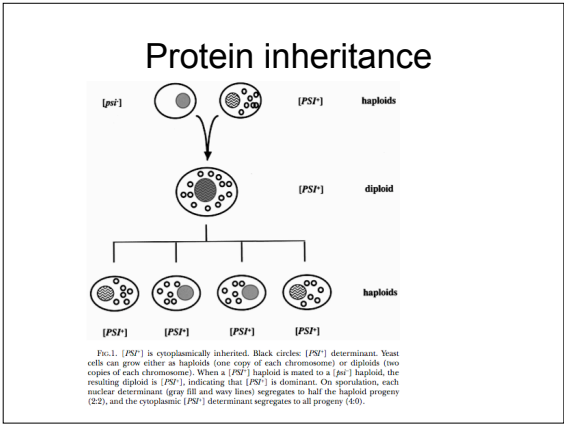

Cytoplasmic aggregates of Sup35

How would this explain the results?

Hard to make aggregate, easy to join

Is *PSI+* the yeast analog of mad cow or Alzheimer's?

If bad, would be lost

A yeast prion provides a mechanism for genetic variation and phenotypic diversity

Huber S, Tok & Eisen J, Lipshitz

PSI+ phenotypes

Why would aggregates result in so many novel abilities and traits??

PSI+ phenotypes

Why would aggregates result in so many novel abilities and traits??

Apparently does not happen in Alzheimer's...

The clincher

Epigenetic regulation of translation reveals hidden genetic variation to produce complex traits

Heather L. Toor¹, Sara Berthé & Susan L. Lindquist

The clincher

Epigenetic regulation of translation reveals hidden genetic variation to produce complex traits

Heather L. Toor¹, Sara Berthé & Susan L. Lindquist

The clincher

Epigenetic regulation of translation reveals hidden genetic variation to produce complex traits

Heather L. Toor¹, Sara Berthé & Susan L. Lindquist

- What do you conclude?
- Sup35 does not cause resistance to paraquat.
 - Prions do not cause resistance to paraquat.
 - Aggregation is not necessary to cause resistance to paraquat.
 - Aggregation is not sufficient to cause resistance to paraquat.

The clincher

Epigenetic regulation of translation reveals hidden genetic variation to produce complex traits

Heather L. Toor¹, Sara Berthé & Susan L. Lindquist

Aggregates per se don't cause resistance.

The clincher

Aggregates per se don't cause resistance. Losing function of sup35 does.

Epigenetic regulation of translation reveals hidden genetic variation to produce complex traits

Huthner L. Tour*, Sara Barthe & Susan L. Lindquist

Aggregation = more read-through

FIG. 3. Model for the [PSI⁺] phenotype. The black line denotes a messenger RNA with a stop codon mutation in the coding sequence. In [psi⁻] cells (top), Sup35 (hatched spheres with black, crescent tails) is soluble and binds to Sup45 (black crescent). The Sup35/Sup45 complex promotes translation termination at all nonsense codons (stop). In [PSI⁺] cells (bottom), Sup35 forms aggregates in the cytoplasm through interaction of the N-terminal domain (black crescent). The level of soluble Sup35 available for binding to Sup45 is greatly reduced. Consequently, ribosomes (gray spheres) are able to read through nonsense codons at a low frequency (dashed arrow), leading to the production of full-length protein, which suppresses the effects of the mutation.

Aggregation = more read-through

New extra-long forms of proteins cause new traits.

FIG. 3. Model for the [PSI⁺] phenotype. The black line denotes a messenger RNA with a stop codon mutation in the coding sequence. In [psi⁻] cells (top), Sup35 (hatched spheres with black, crescent tails) is soluble and binds to Sup45 (black crescent). The Sup35/Sup45 complex promotes translation termination at all nonsense codons (stop). In [PSI⁺] cells (bottom), Sup35 forms aggregates in the cytoplasm through interaction of the N-terminal domain (black crescent). The level of soluble Sup35 available for binding to Sup45 is greatly reduced. Consequently, ribosomes (gray spheres) are able to read through nonsense codons at a low frequency (dashed arrow), leading to the production of full-length protein, which suppresses the effects of the mutation.

PSI⁺ allows epigenetic change in protein sequence.

Genetic effects?

Phenotypes varied between genetically diverse PSI⁺ strains.

Genetic effects?

Phenotypes varied between genetically diverse PSI⁺ strains.

How can the cause be genetic and non-genetic (protein aggregates) at the same time?

Aggregation = more read-through

FIG. 3. Model for the *[PSI⁻]* phenotype. The black line denotes a messenger RNA with a stop codon mutation in the coding sequence. In *[psi⁻]* cells (top), Sup35 (dashed spheres with black, crescent tails) is soluble and binds to Sup45 (black crescent). The Sup35/Sup45 complex promotes translation termination at all nonsense codons (stop). In *[PSI⁺]* cells (bottom), Sup35 forms aggregates in the cytoplasm through interaction of the N-terminal domain (black crescent). The level of soluble Sup35 available for binding to Sup45 is greatly reduced. Consequently, ribosomes (gray spheres) are able to read through nonsense codons at a low frequency (dashed arrow), leading to the production of full-length protein, which suppresses the effects of the mutation.

Aggregation = more read-through

UTR mutations usually occur and have no effect

FIG. 3. Model for the *[PSI⁻]* phenotype. The black line denotes a messenger RNA with a stop codon mutation in the coding sequence. In *[psi⁻]* cells (top), Sup35 (dashed spheres with black, crescent tails) is soluble and binds to Sup45 (black crescent). The Sup35/Sup45 complex promotes translation termination at all nonsense codons (stop). In *[PSI⁺]* cells (bottom), Sup35 forms aggregates in the cytoplasm through interaction of the N-terminal domain (black crescent). The level of soluble Sup35 available for binding to Sup45 is greatly reduced. Consequently, ribosomes (gray spheres) are able to read through nonsense codons at a low frequency (dashed arrow), leading to the production of full-length protein, which suppresses the effects of the mutation.

Aggregation = more read-through

UTR mutations usually occur and have no effect, so organism doesn't die and allele is maintained.

FIG. 3. Model for the *[PSI⁻]* phenotype. The black line denotes a messenger RNA with a stop codon mutation in the coding sequence. In *[psi⁻]* cells (top), Sup35 (dashed spheres with black, crescent tails) is soluble and binds to Sup45 (black crescent). The Sup35/Sup45 complex promotes translation termination at all nonsense codons (stop). In *[PSI⁺]* cells (bottom), Sup35 forms aggregates in the cytoplasm through interaction of the N-terminal domain (black crescent). The level of soluble Sup35 available for binding to Sup45 is greatly reduced. Consequently, ribosomes (gray spheres) are able to read through nonsense codons at a low frequency (dashed arrow), leading to the production of full-length protein, which suppresses the effects of the mutation.

Aggregation = more read-through

UTR mutations usually occur and have no effect, so organism doesn't die and allele is maintained. Now in *PSI⁺*, they manifest!

FIG. 3. Model for the *[PSI⁻]* phenotype. The black line denotes a messenger RNA with a stop codon mutation in the coding sequence. In *[psi⁻]* cells (top), Sup35 (dashed spheres with black, crescent tails) is soluble and binds to Sup45 (black crescent). The Sup35/Sup45 complex promotes translation termination at all nonsense codons (stop). In *[PSI⁺]* cells (bottom), Sup35 forms aggregates in the cytoplasm through interaction of the N-terminal domain (black crescent). The level of soluble Sup35 available for binding to Sup45 is greatly reduced. Consequently, ribosomes (gray spheres) are able to read through nonsense codons at a low frequency (dashed arrow), leading to the production of full-length protein, which suppresses the effects of the mutation.

Aggregation = more read-through

Sequence differences in read-through region cause phenotypic differences between *PSI⁺* strains.

FIG. 3. Model for the *[PSI⁻]* phenotype. The black line denotes a messenger RNA with a stop codon mutation in the coding sequence. In *[psi⁻]* cells (top), Sup35 (dashed spheres with black, crescent tails) is soluble and binds to Sup45 (black crescent). The Sup35/Sup45 complex promotes translation termination at all nonsense codons (stop). In *[PSI⁺]* cells (bottom), Sup35 forms aggregates in the cytoplasm through interaction of the N-terminal domain (black crescent). The level of soluble Sup35 available for binding to Sup45 is greatly reduced. Consequently, ribosomes (gray spheres) are able to read through nonsense codons at a low frequency (dashed arrow), leading to the production of full-length protein, which suppresses the effects of the mutation.

Cryptic variation: DNA sequence differences between individuals that are usually not expressed
