

# Lecture 9

## Regulation of the Cell Cycle

### Outline:

Overview

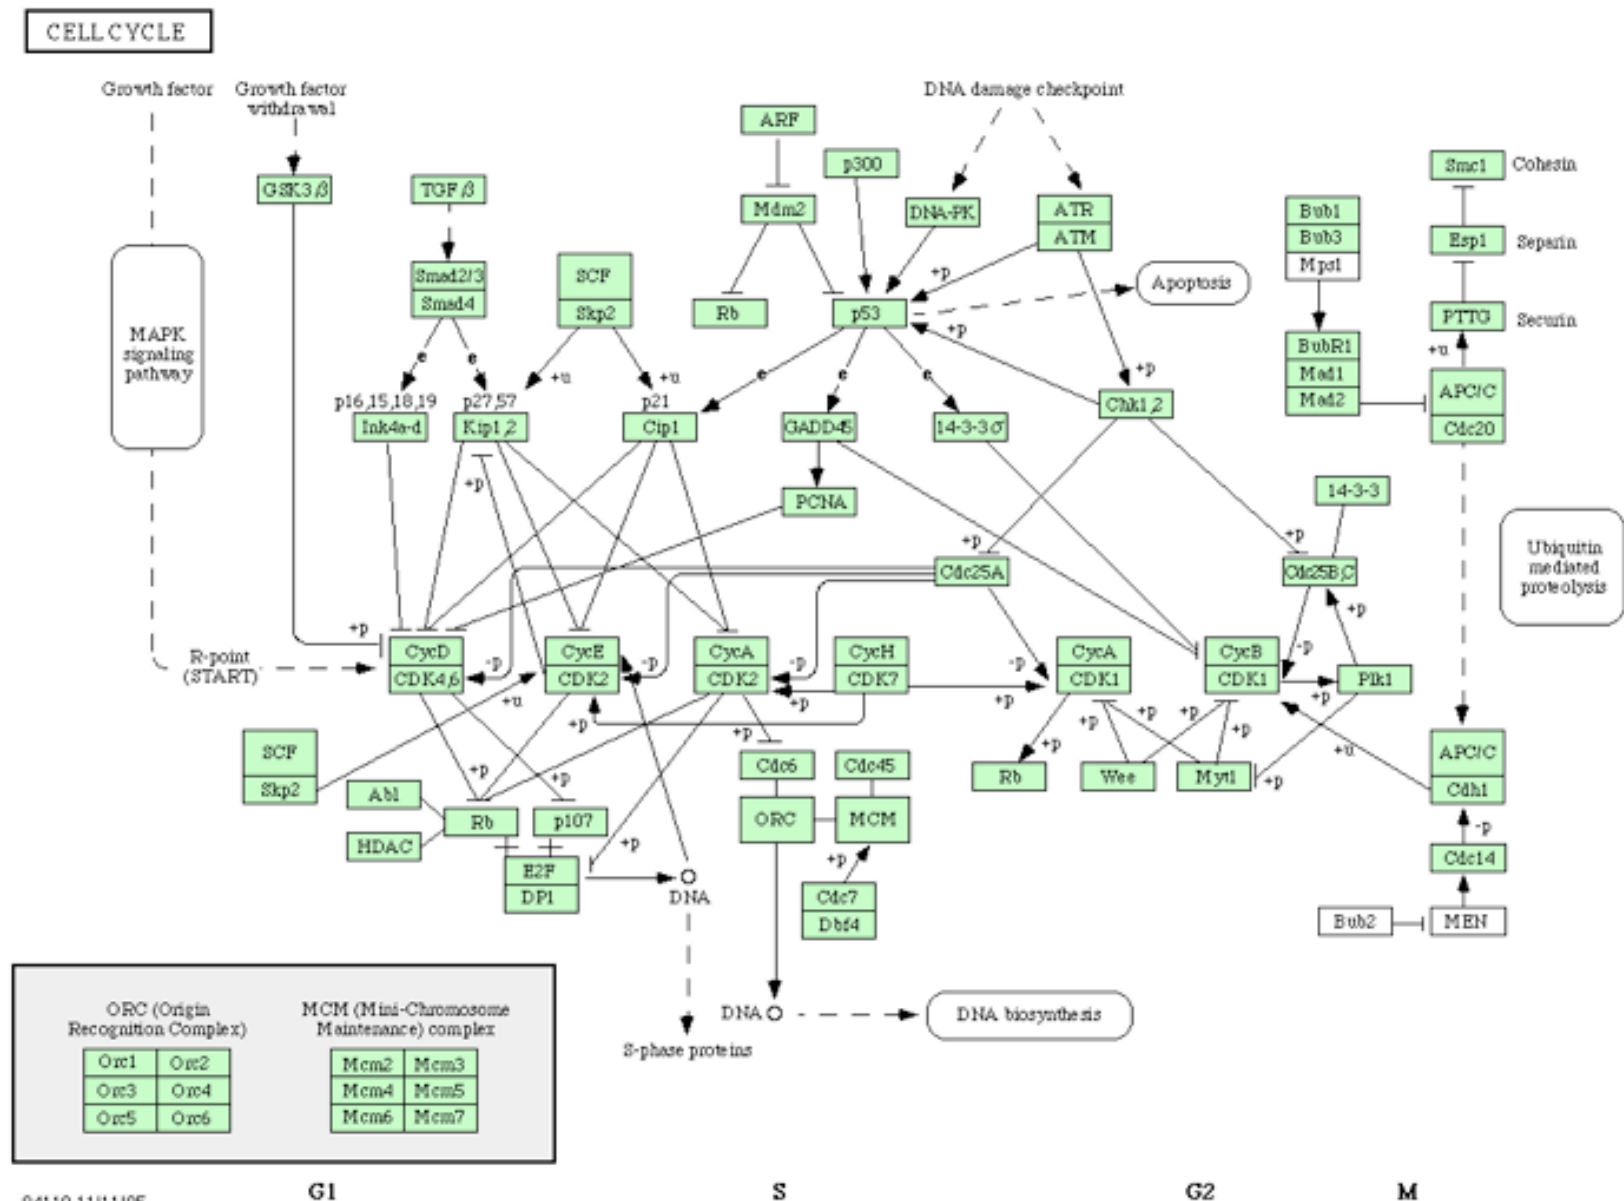

Identification of MPF, Cyclins and CDKs

Identification of the controllers

Regulation of Mitosis by Phosphorylation and Degradation

Paper:

# CC Regulation is VERY Complex

# Overview of CC Regulation

# Two Views of CC Regulation Logic

**‘Dominos’  
sequential, dependent  
events**

(A)

**‘Oscillator’  
central controller**

(B)

**both are involved**

# Evidence for 'Master Controllers'

**Experiment 1**

**Experiment 2**

**S phase 'cytoplasm' dominant over G<sub>1</sub>    M 'cytoplasm' dominant over interphase**

# The Discovery of MPF

## Xenopus and sea urchin egg extracts

transfer of mitotic cytoplasm induces mitosis

**MPF**- Maturation Promoting Factor, now Mitosis Promoting Factor

# MPF activity oscillates during the cell cycle

activity **correlates with meiotic and mitotic divisions**

**suggested that CC regulated by central controller**

# MPF (and SPF) are Cyclin-CDK complexes

## CDKs

Cyclin Dependent Kinases

S/T kinases

phosphorylate factors that drive CC processes

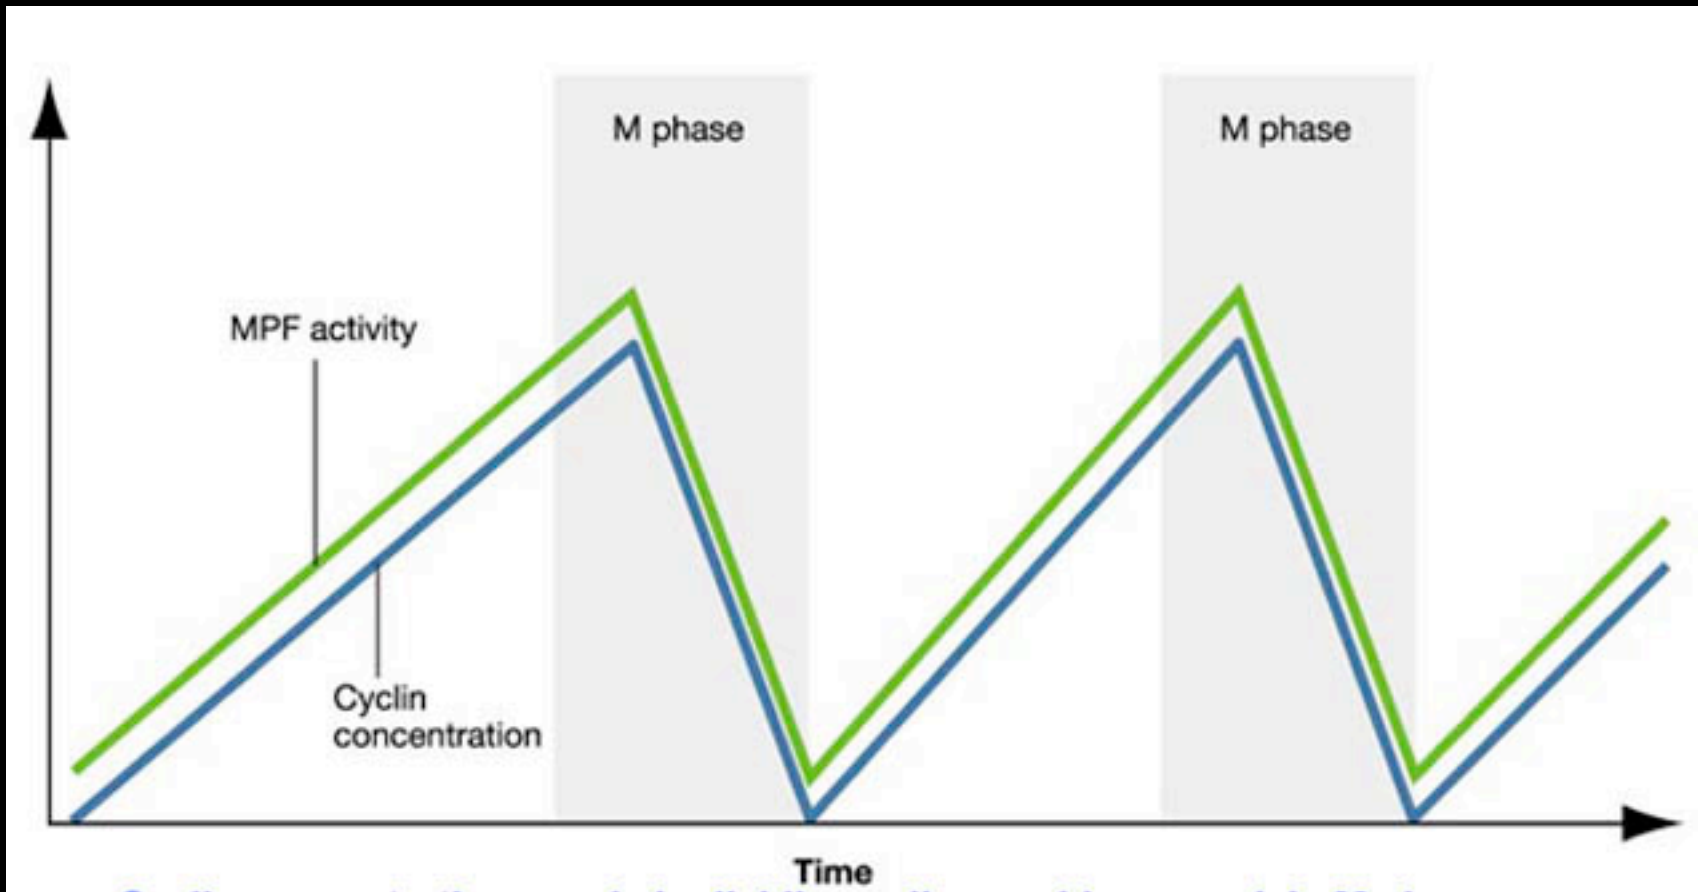

## Cyclins

CDK activators

different cyclins for S and M

degradation inactivates CDKs

# Cyclin concentration regulates MPF activity

## Cyclins and CDKs in yeasts and metazoans

**TABLE 17-1** The Major Cyclins and Cdks of Vertebrates and Budding Yeast

CYCLIN-CDK COMPLEX	VERTEBRATES		BUDDING YEAST	
	CYCLIN	CDK PARTNER	CYCLIN	CDK PARTNER
G <sub>1</sub> -Cdk	cyclin D*	Cdk4, Cdk6	Cln3	Cdk1**
G <sub>1</sub> /S-Cdk	cyclin E	Cdk2	Cln1, 2	Cdk1
S-Cdk	cyclin A	Cdk2	Clb5, 6	Cdk1
M-Cdk	cyclin B	Cdk1**	Clb1, 2, 3, 4	Cdk1

**G<sub>1</sub>**

**Sense cell size, Commit to division**

**S**

**Activate replication origins**

**M**

**Spindle assembly, anaphase, exit**

# Nuclear location of Cyclin B regulated at onset of Mitosis

**Cyclin B**

**DIC**

**G2  
cytoplasmic**

**Prophase  
nuclear**

**due to Nuclear Envelope Breakdown (NEB)**

# The Identification of CC Regulator Proteins

**‘Dominos’  
sequential, dependent  
events**

**‘Oscillator’  
central controller**

**Genetic Screens: Yeast ‘Cell Division Cycle’ (CDC) Mutants**

can individual protein mutations block steps or whole process ?

provided evidence that both are involved

# The Identification of CC Regulator Proteins using YEASTS

## Advantages:

rapidly growing, divides every 90 min

powerful genetics

cell cycle progress easy to follow

## Disadvantages:

different from higher eukaryotes

nuclear envelope does not break down in M-phase

spindle assembly occurs during DNA replication  
(budding yeast)

little or no chromosome condensation in M-phase

# Pombe and cerevisiae life cycles

(A) FISSION YEAST (*Schizosaccharomyces pombe*)

(B) BUDDING YEAST (*Saccharomyces cerevisiae*)

**Cell cycle coordinated with growth at two points: G<sub>1</sub>/S and G<sub>2</sub>/M**

**WT fission yeast:** cells born large enough to pass start

G<sub>1</sub>/S transition less visible - long G<sub>2</sub>

**WT budding yeast:** cells big enough to pass start and to enter mitosis  
(committed to divide even in absence of nutrients)

G<sub>2</sub>/M transition less visible - long G<sub>1</sub>

# Genetic Screens: Yeast 'Cell Division Cycle' (CDC) Mutants

- Lee Hartwell (*cerevisiae*); Paul Nurse (*pombe*)
- Goal: find mutants unable to transit the cell cycle
- Why yeast?
  - Cell shape --> cell cycle stage
  - Grow as haploids (easier to find mutants), or diploids (can do genetics)
- Problem:
  - the screen is for cells that can't grow
- Solution:
  - temperature sensitive mutants
  - Replica plating

# CDC Screen: TS Cell cycle arrest after mutagenesis

(A) PERMISSIVE (LOW) TEMPERATURE

A. Model of the cell cycle as a simple dependent pathway

B. Wild type

C. CDC mutant

**clone genes and identify proteins by transfecting random plasmids and looking for rescue**

## Note on yeast nomenclature

### **S. cerevisiae (budding yeast)**

wild type or dominant  
mutations  
protein

CDC28  
cdc28-4<sup>ts</sup>,  $\Delta$ cdc28  
Cdc28

### **S. pombe (fission yeast)**

wild type or dominant  
mutations  
protein

cdc2<sup>+</sup> cdc2<sup>D</sup>  
cdc2<sup>ts</sup> cdc2<sup>-</sup>  
Cdc2

# Pombe mutant phenotypes

**A. Wild type**

**B. *wee* mutant**

**C. *Cdc25* mutant**

(a)

Deficit of Cdc25  
Excess of Wee1

Elongated cells  
(Increased  $G_2$ )

Excess of Cdc25  
Deficit of Wee1

Small cells  
(Decreased  $G_2$ )

# Cdc25 and Wee1 regulate Cdk phosphorylation and activity

# CDKs are activated by phosphorylation (CAKs)

requires binding of Cyclins to CDKs

**Cdk**

**Cdk + Cyclin**

**partially active**

**active**

# Feedback Loops maintain M-Cdk Activity

## Cyclin B

**Active M-Cdk inhibits Wee inhibitory kinase and activates Cdc25 activating kinase**

# Cyclin levels are regulated during the cell cycle

**Cyclin B**

# Cyclins are regulated during the cell cycle

## Drosophila embryos

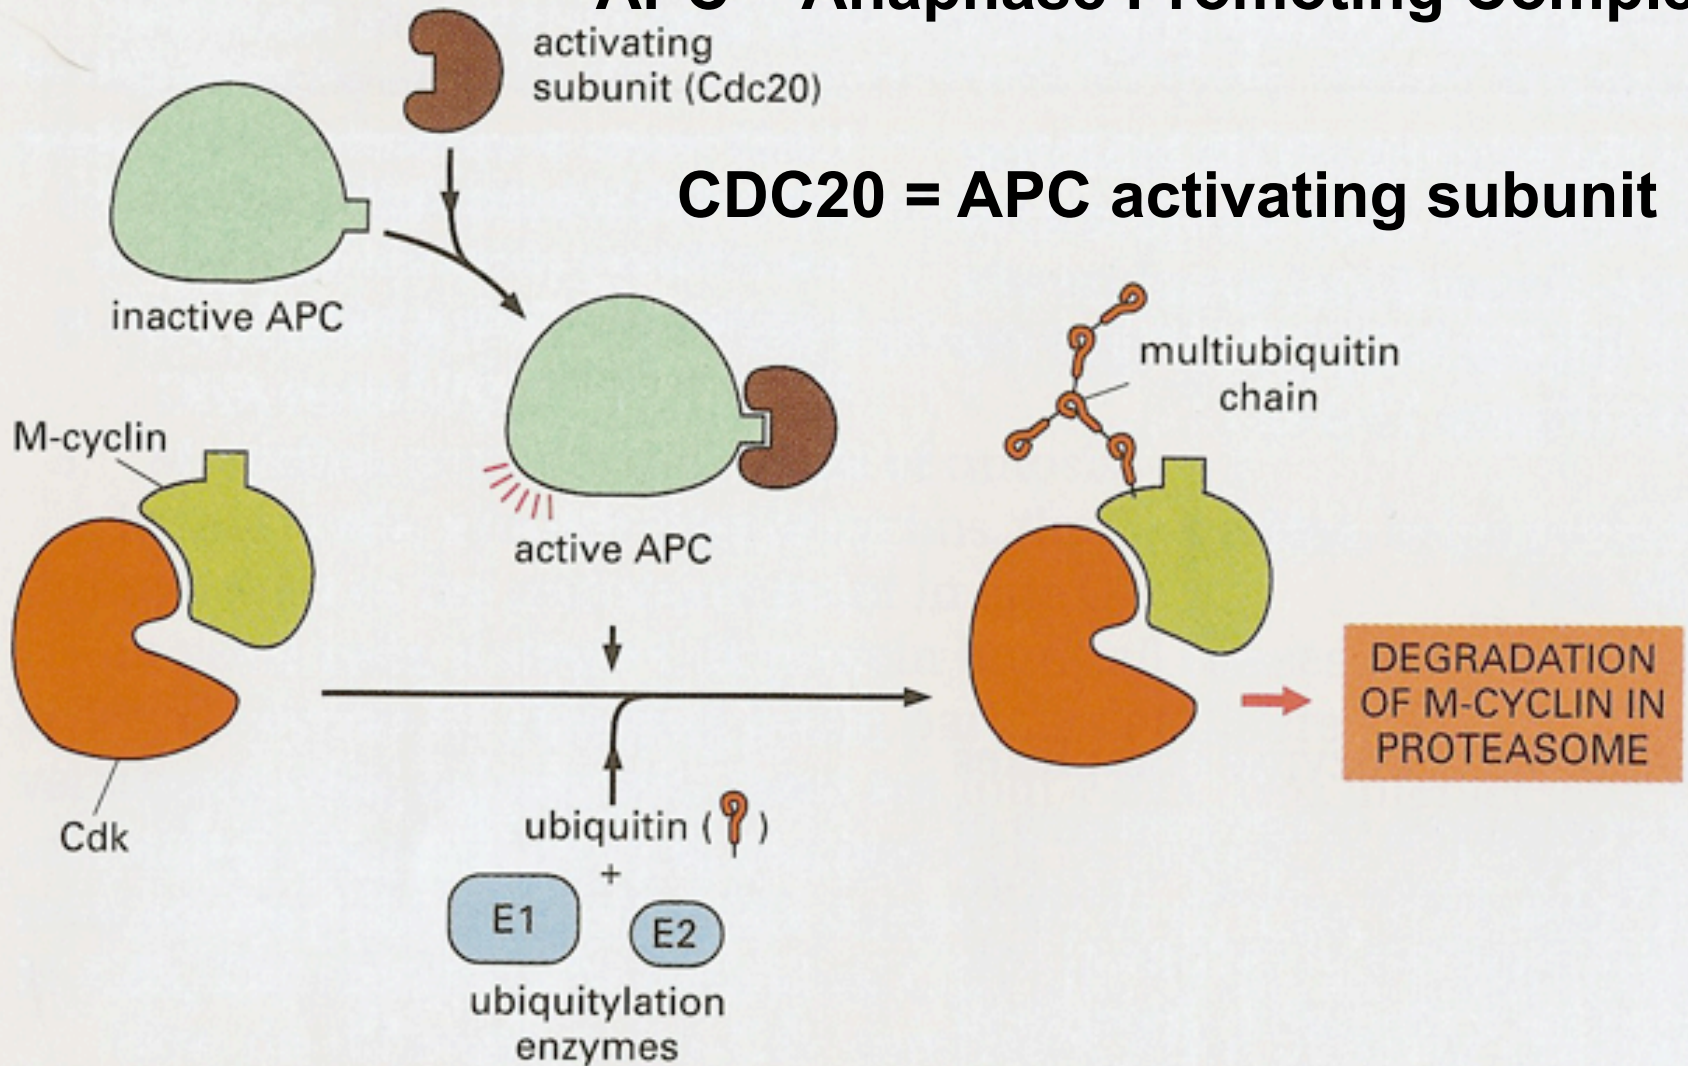

Cyclin B

# Cyclins are regulated by proteolysis

(B) control of proteolysis by APC

**APC = Anaphase Promoting Complex**

**CDC20 = APC activating subunit**

# Two modular complexes that direct proteolysis

## E3 ubiquitin ligases

### APC

anaphase start & M exit

subunits  
phosphorylated

### SCF

G1/S

substrates  
phosphorylated

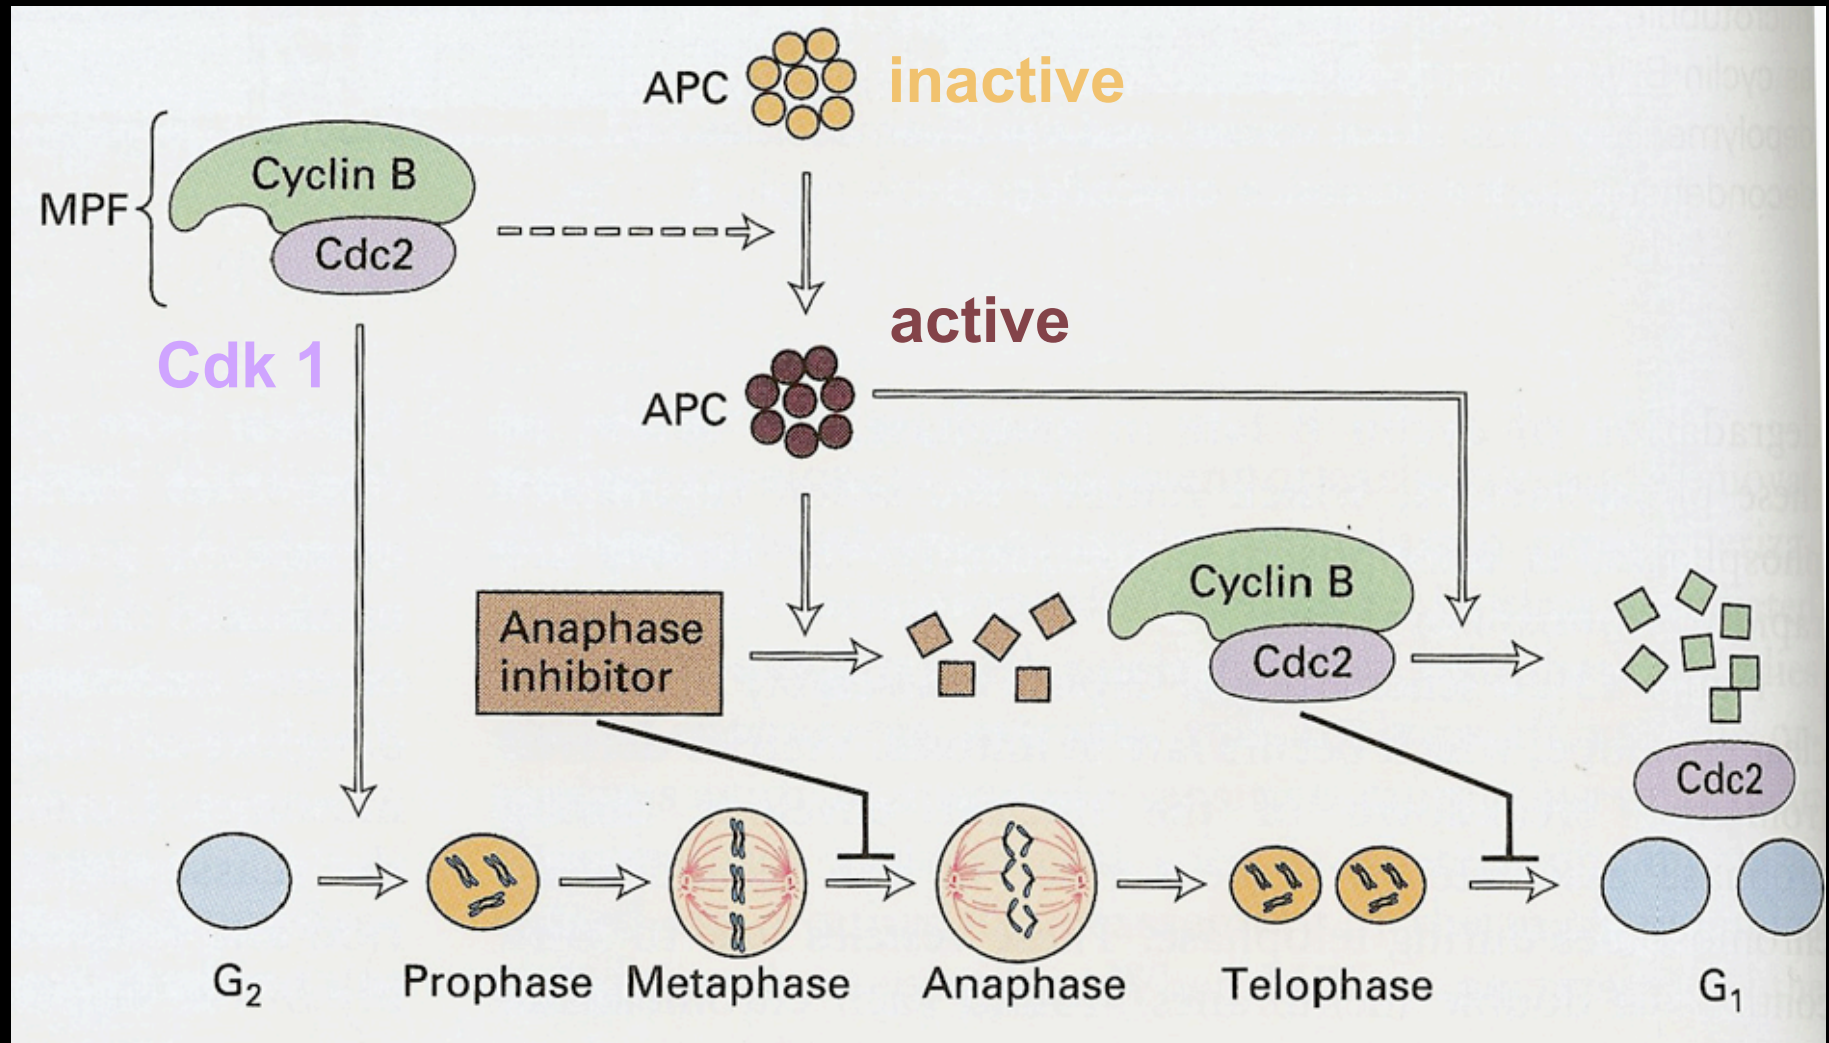

# CDK activity and Cyclin levels are correlated with APC levels

active APC correlates with loss of Cyclins and CDK inactivity

# The APC is required for anaphase entry and exit from mitosis

# Inhibition of APC and Cyclin degradation result in different phenotypes

(A) APC INHIBITION

metaphase  
arrest

**need active APC to  
enter anaphase**

(B) NONDEGRADABLE  
M-CYCLIN

anaphase  
arrest

**need to degrade  
CycB to exit mitosis**

# APC mediated degradation of securin and chromatin separation

# A non-destructible form of Cyclin B delays exit from mitosis

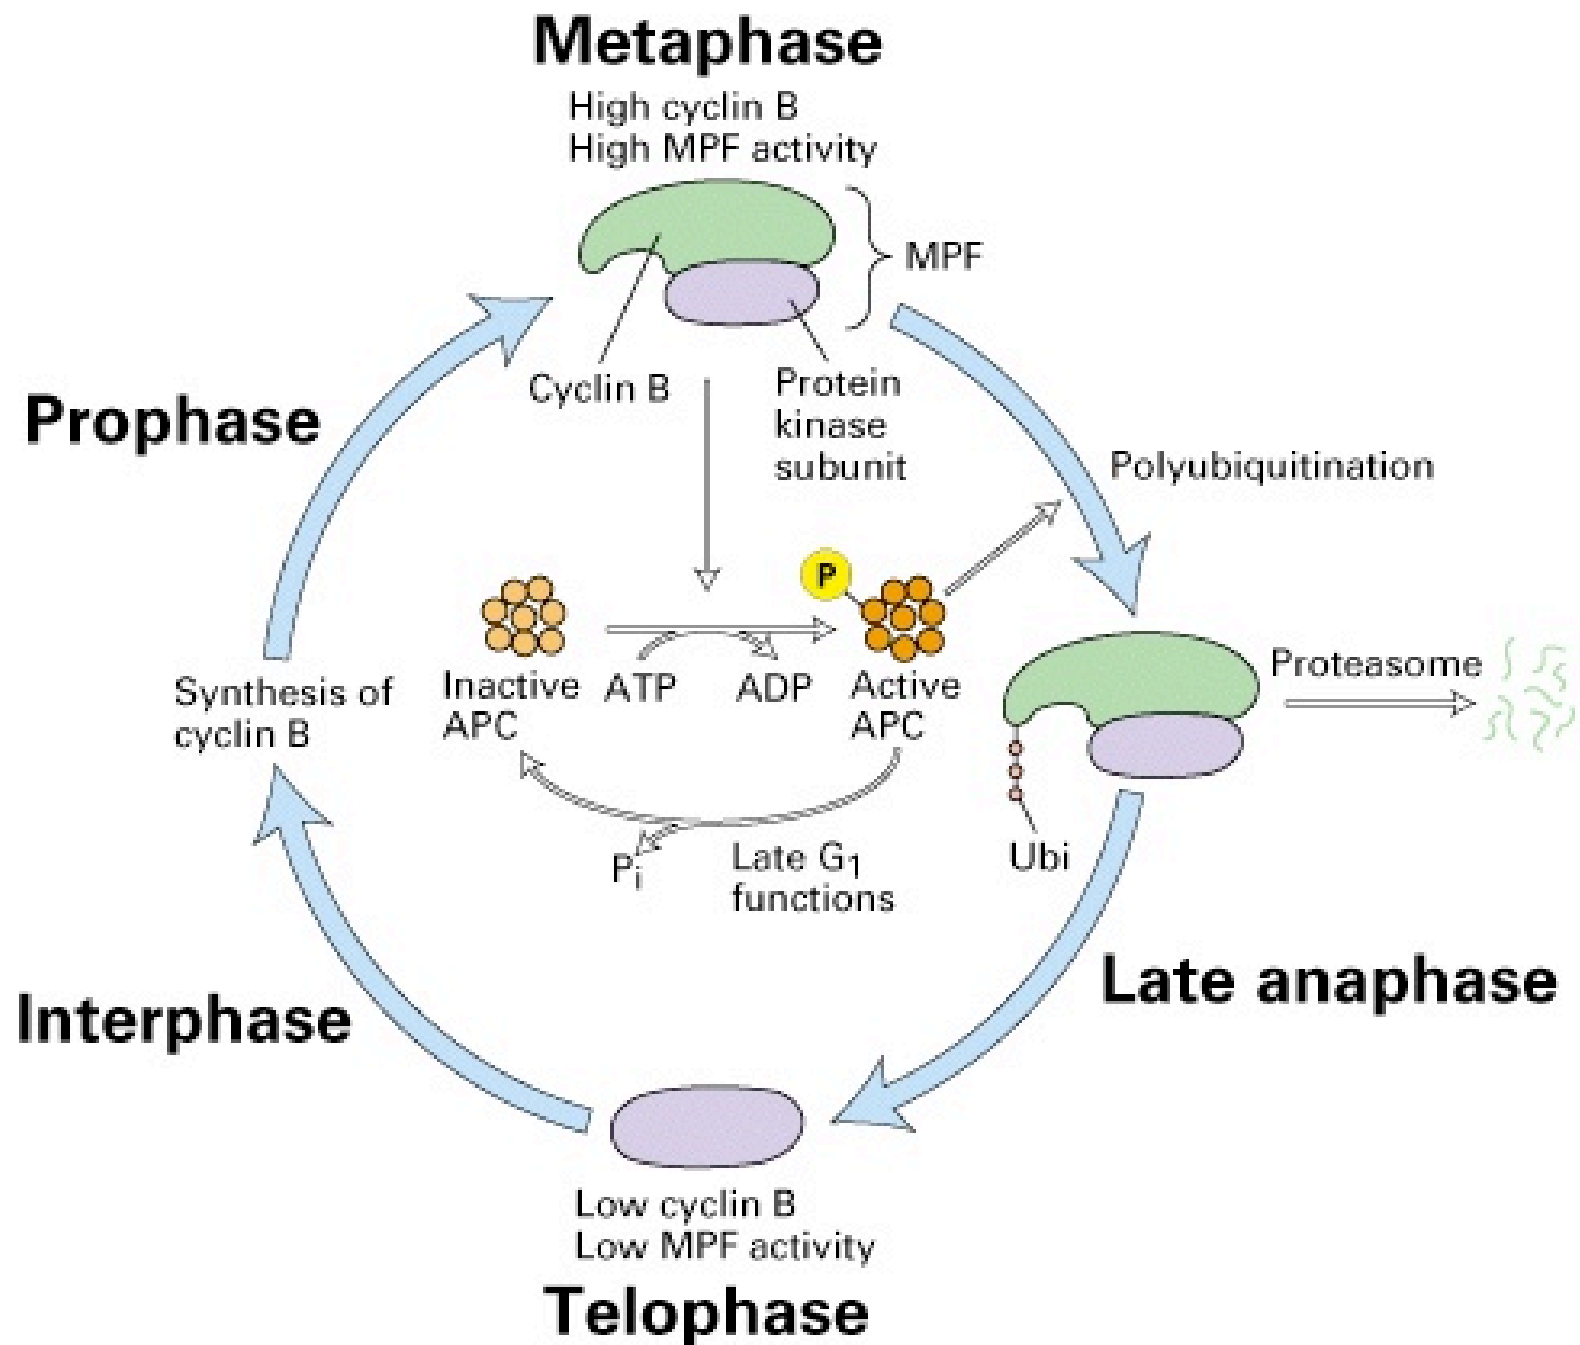

**Cyclin B**

# APC is regulated by Cdh1 phosphorylation

**feedback between Cdk/Cyclins and APC**

# CDK functions: Downstream effects of MPF activation

# Lamins are phosphorylation prior to NE breakdown

**at onset of mitosis**

# Lamins phosphorylation is required for NE breakdown
